Aplica (Brussels, Belgium)**

**January 2010  
Budapest – Brussels**

THE CONSORTIUM FORMED BY TÁRKI SOCIAL RESEARCH INSTITUTE (BUDAPEST) AND APPLICA SPRL. (BRUSSELS) WAS COMMISSIONED BY THE DG EMPLOYMENT, SOCIAL AFFAIRS AND EQUAL OPPORTUNITIES UNIT E.2 OF THE EUROPEAN COMMISSION TO CARRY OUT THE PROJECT (VC/2008/0287). THE REPORT IS A JOINT EFFORT OF THE CONSORTIUM AND OF OTHER AFFILIATED EXPERTS.

**CONTRACTOR: TÁRKI SOCIAL RESEARCH INSTITUTE, BUDAPEST**

**RESPONSIBLE: ISTVÁN GYÖRGY TÓTH (TÁRKI)**

**CO-DIRECTORS: ISTVÁN GYÖRGY TÓTH (TÁRKI) AND TERRY WARD (APPLICA)**

**PROJECT COORDINATOR: ANDRÁS GÁBOS (TÁRKI)**

This publication is supported under the European Community Programme for Employment and Social Solidarity (2007-2013). This programme is managed by the Directorate-General for Employment, Social Affairs and Equal Opportunities of the European Commission. It was established to financially support the implementation of the objectives of the European Union in the employment and social affairs area, as set out in the Social Agenda, and thereby contribute to the achievement of the Lisbon Strategy goals in these fields.

The seven-year Programme targets all stakeholders who can help shape the development of appropriate and effective employment and social legislation and policies, across the EU-27, EFTA-EEA and EU candidate and pre-candidate countries.

PROGRESS mission is to strengthen the EU contribution in support of Member States' commitments and efforts to create more and better jobs and to build a more cohesive society. To that effect, PROGRESS will be instrumental in:

- providing analysis and policy advice on PROGRESS policy areas;
- monitoring and reporting on the implementation of EU legislation and policies in PROGRESS policy areas;
- promoting policy transfer, learning and support among Member States on EU objectives and priorities; and
- relaying the views of the stakeholders and society at large.

Source: Own calculation based on EU-SILC 2007, version 01.03.2009.

Note. \*Excluding Malta.

Note. The transfer distribution index (TDI) expresses the share of transfers going to children in a specific group relative to the share of children in that specific group among all children.

**Table A1.1.31 Distribution of social transfers (excl. pensions) – TDI for children at-risk-of-poverty, and by main household characteristics, EU-25\*, 2007**

|        | All children | Age of child |      |       | Household type |                 |                  | Work intensity  |           |                       | Migrant background |              |         |             |          |            |

Source: Own calculation based on EU-SILC 2007, version 01.03.2009.

Note. \*Excluding Malta. The poverty reduction impact expresses the difference between the at-risk-of-poverty rate before and after transfers, either as a simple difference (in percentage points), or as the difference relative to the rate before transfers (%).

**Table A1.1.33a Poverty reduction impact of social transfers (excl. pensions) among children EU-25\*, 2007 (as percentage of at-risk-of-poverty rate before transfers)**

Source: Own calculation based on EU-SILC 2007, version 01.03.2009.

Note. \*Excluding Malta. Transfers for children include: family/child-related benefits, housing allowances and other social exclusion benefits as defined by the EU-SILC. The poverty reduction impact expresses the difference between the at-risk-of-poverty rate before and after transfers, either as a simple difference (in percentage points), or as the difference relative to the rate before transfers (%).

**Table A1.1.35 Distribution of parents by the type of childcare used for their youngest child, by the age of the youngest child, 2007**

## Annex 1.2 Methodological description for the work intensity of household

### Estimates of work intensity including the effect of part-time working

In the standard Eurostat measurement of work intensity, allowance is made for the number of months during the year working-age members of the household spend not working, but no allowance is made for part-time working. The measure set out below incorporates part-time working in the definition of work intensity and makes a few other changes to the Eurostat indicator in order to derive an arguably more meaningful estimate of work intensity which can be related to income.

In the same way as the standard measure, work intensity is calculated to cover all members of households aged 18-64 and relates to the cumulative months spent in different activity states during the preceding year (the year to which income relates). The revised formula is

$$\sum_{18}^{64} \frac{fitem_i + a_i * ptem_i}{fitem_i + ptem_i + unem_i + stm_i + rm_i + inacm_i}$$

in which:

**fitem**=total months in full-time employment of each household member in the relevant age group over the last 12-month income period

**ptem**=total months of each household member in part-time employment over the last 12-month income period

**a<sub>i</sub>**= weight for part-time working hours of household member (average usual hours spent in part time employment per week/35 – 35 being taken as the minimum number of full-time weekly hours), which is assumed to have a maximum value of one (when usual hours worked are equal to assumed full-time hours)

**unem**=total months in unemployment of each household member in the last 12-month income period

**stm**= total months in studying of each household member in the last 12-month income period

**rm**=total months in retirement of each household member in the last 12-month income period

**inacm**=total months in inactivity of each household member in the last 12-month income period

The data for the months spent by each individual household member in these various employment states are taken from the EU-SILC personal dataset.

The major difference between this measure and the Eurostat one is the application of a weight to the months spent in part-time employment which in almost all cases will be less than one (these months are implicitly assigned a weight of one in the Eurostat calculation). The weight applied is based on the data given for the average number of usual hours a week spent working in their current employment (including in both their main job and any additional jobs) for those indicating that they were employed part-time for at least some months of the year. It is assumed, therefore, that the hours in question are the same as usually worked during the reference year, which in some cases may not be a valid assumption (though this also applies to the assumption made in the calculation of household income that the composition of the household was the same in the reference year as at the time the survey was undertaken). In cases where a person indicates working part-time for at least one month during the reference year but currently works full-time or does not work at all, an average estimate of part-time hours is used as a weight.

A second, much minor, difference is the inclusion of months spent in full-time education in the denominator of the formula, which are excluded in the Eurostat calculation. For both reasons, the estimates of work intensity calculated using the above measure will in a number of cases be less than the Eurostat measure.

In addition, a slightly different grouping of the estimated values for the work intensity indicator has also been taken in order to provide a more meaningful division and to overcome the major deficiency of the Eurostat division which makes it impossible to distinguish couple households in which one person worked throughout the year from those in which one person was employed throughout the year and the other was also employed but worked for less than 12 months during the year. (Both of these in the

Eurostat categorisation are included in the 0.5 to 1 group.) The revised, and more detailed, grouping is shown in the table below together with the standard Eurostat grouping, data for which are included in the EU-SILC dataset.

## **Annex 1.3 A detailed measure of work intensity**

A new measure of work intensity of household has been introduced in Section 1.1.3.2 of the Study and Annex 1.2 explains on methodological details. The original measure could take values from 0 to 1, but it has been transformed in a five-category variable to ease the interpretation, to attribute content to given values in terms of different household arrangements are likely to be associated with these values and to carry out group-specific analysis. In this Annex we provide an analysis based on a somewhat detailed categorisation of the work intensity variable, being aware of the decrease in the number of observations, which could harm statistical robustness.

Two questions arise:

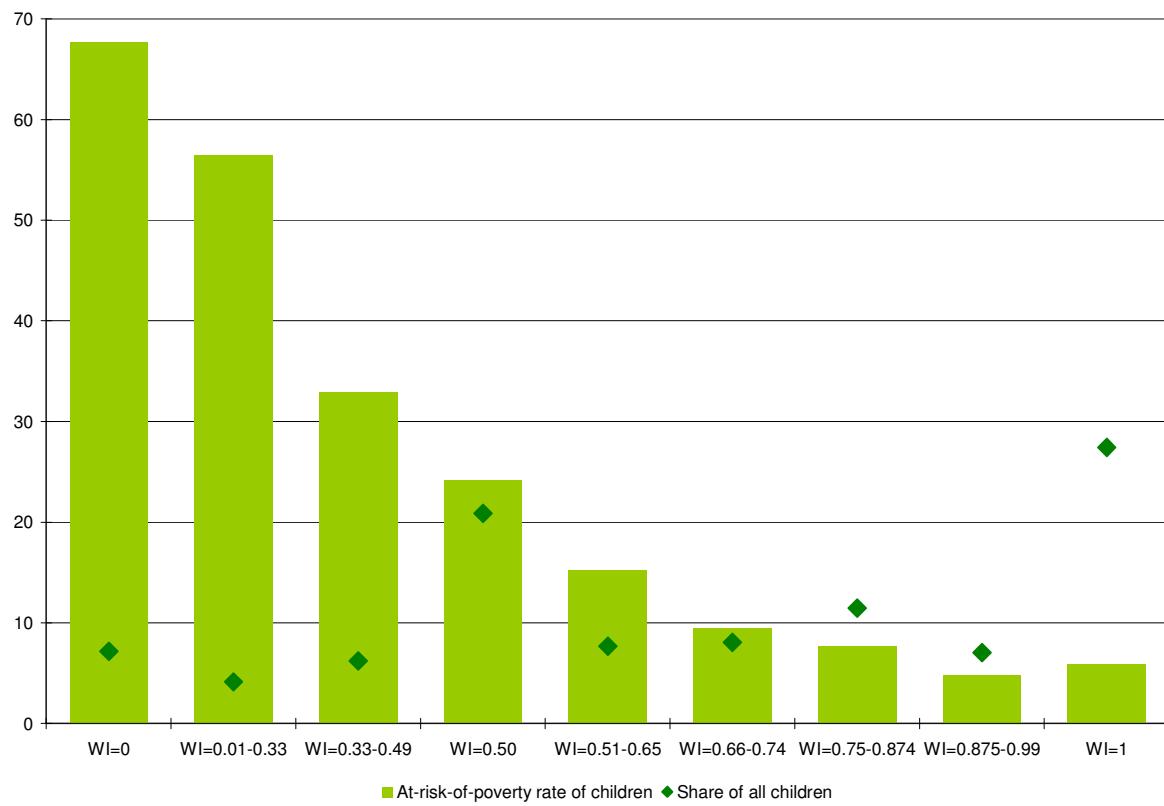

1. What amount of work at household level is needed to considerably reduce the risk of poverty among children?
2. What combination of activity statuses of adult household members are represented by different work intensity categories?

Compared to the five-category measure, the one presented here introduces one additional cutpoint in the range between 0.01 and 0.49 at the value of 0.33 and three additional cutpoints in the range between 0.51 and 0.99 at 0.66, 0.75 and 0.875. Figure A1.3.1 shows results on the distribution of children and their risk of poverty by work intensity categories, while Table A1.3.1 provides information on the main indicators (distribution of all children, at-risk-of-poverty rate and distribution of children at-risk-of poverty) of child poverty by this measure of work intensity in each Member State.

According to this measure, 7% of all children in the European Union live in households with null work intensity, 4% of them in very low work intensity households (0.01-0.33), while 5% of them in low work intensity households (0.34-0.49). While the share of children in each of these categories is fairly low, looking at the risk of poverty faced by them suggest that a cutpoint established at the 0.33 value of the work intensity measure strongly differentiates between children at very high (above 50%) risk of poverty and those with a still high, but considerably lower (around 33%) risk of poverty. These figures suggest that one parent (mostly the father) working full-time provides some protection against poverty, but other adults (presumably the mother and the older child) being inactive, keeps the at-risk-of-poverty rate well above the average when looking at the EU as a whole (see Tables A1.3.2 and A1.3.3 for the composition of households by the activity status of their adult members).

For the range of values in-between 0.50 and 1.0, the share of children in those four categories varies between 7% and 11%. At EU level, in all categories, the risk of poverty of children is below the average, but is above 10% only for children in households with work intensity of 0.51-0.65 (15%). In these households dominantly one adult is full-time employed, while the others are either in part-time employment or at home (see Tables A1.3.2 and A1.3.3). The same arrangement characterise those in households with 0.66-0.74 work intensity, but the average number of full-time employed household members is considerably higher (1.3 instead of 0.95 for those in 0.51-0.66 category). Accordingly the risk of poverty of these children is fairly low (9%), closer to those in households with work intensity of 1.0 or close to 1.0.

## Annex 1.4 EUROMOD

EUROMOD is a static tax-benefit microsimulation model currently covering all 15 pre-2004 Member States of the European Union plus Estonia, Hungary, Poland and Slovenia. See Lietz and Mantovani (2006) and Sutherland (2007) for general descriptions. Sutherland (2001 and 2005) provides further discussions of technical issues. EUROMOD calculates cash benefit entitlements and direct tax and social insurance contribution liabilities on the basis of the tax-benefit rules in place, and any reforms specified by the user. Thus it is able to examine the impact effects of policies from country A on the population with demographic, economic and social characteristics of country B. The currently available policy years are shown in the following table

| Policy year | EE | HU | PL | SI | EL | ES | BE | DE | LU | NL | AT | PT | FI | UK | DK | IE | FR | IT | SE |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1998        |    |    |    |    | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  |    |
| 2001        |    |    |    |    | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  |    |
| 2003        |    |    |    |    | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  | +  |    |    |
| 2005        | +  | +  | +  | +  | +  | +  | +  |    |    |    |    |    |    |    |    |    |    |    |    |

The underlying input micro-data, derived from a number of sources either matches the policy year or precedes it by a few years (and is then uprated), with some exceptions. A current programme of work aims to update both policy rules and underlying data on a regular basis. See <http://www.iser.essex.ac.uk/msu/emod/> for more information.

## Annex 1.5 International benchmarking and key challenges for each Member State

Table 1.5.1. Relative outcomes of countries related to child poverty risk and main determinants of child poverty risk, 2005

|         |    | Child poverty risk outcomes | Joblessness: children living in <u>jobless</u> households | In-work poverty: children living in households confronted with <u>in-work</u> poverty | Impact of <u>social transfers</u> (cash benefits excl. pensions) on child poverty |
|---------|----|-----------------------------|-----------------------------------------------------------|---------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Group A | AT | ++                          | +                                                         | +                                                                                     | ++                                                                                |

Source: Own calculation based on EU-SILC 2007, version 01.03.2009.

Note: Countries are ranked according to scores and grouped in clusters that maximise the “steps” (highlighted in green) between the groups and that minimise the variations within the groups (columns intra).

**Figures A 1.5.1 The resulting clusters of countries, ranked by levels of performance from +++ (left) to - - - (right) – supporting figures for Table 1.24**

**Figures A 1.5.1 The resulting clusters of countries, ranked by levels of performance from +++ (left) to - - - (right) – supporting figures for Table 1.24 (continued)**

**Table A1.5.3a Clustering results supporting the analytical framework in Table 1.24 – detailed calculation of score**

#### Methodology of multivariate analysis of determinants of child poverty

Multivariate analysis of determinants of child poverty has been carried out by running probit models, with child poverty as a dependent variable. Explanatory variables were the following: dummies for child age group (0-5 years, 6-11 years, 12-17 years), dummy for mother age below 30 years, dummy for child living with single parent, dummies for number of children in the household (1 child, 2 children, 3 or more children), dummy for additional adult (other than parent) in the household, parent's education (primary or lower secondary education, upper secondary education, tertiary education), and the household's work intensity ( $wi < 0.50$ ,  $wi = 0.50$ ,  $wi = 0.51-0.99$ ,  $wi = 1.0$ ) and dummy for outside of EU migrant status of parents.

When interpreting the results of a regression model we are interested in the marginal effect of an independent variable, that is the change in the expected value of the dependent variable as the value of the independent variable is increased by unity (or from 0 to 1 in case of dummy variables) and the values of all other independent variables are held constant. In a linear regression model the marginal effect of an independent variable is shown by the estimated regression coefficient. In nonlinear models, like the probit, this is not the case, the marginal effect of a given independent variable varies at different values of other explanatory variables (Long, 1997). To arrive at a measure of the magnitude of the effect of one explanatory variable we use the average marginal effect, which is the sample average of marginal effects. This is a measure which is comparable across groups, models and samples (Mood, 2009) and thus suits well our purpose of comparative analysis. Average marginal effects were estimated by Stata program margeff (Bartus, 2005).

**Table A1.5.5 Probit estimates of average marginal effect of main household factors on child poverty – children in weak labour market attachment households (WI<0.50), EU-25\*, 2007**

|    | Age of children |              | Age of mother | Education of parents |             | Household composition |               |             |              | Migrant status |

|                                | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                | <b>Methodological notes</b>                                                                                | <b>Source of definition</b> |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|-----------------------------|
| Group relative risk of poverty | Ratio of at-risk-of-poverty rate of children belonging to a specific group and overall at-risk-of-poverty rate of children                                                                                                                                                                                                                                       | Units of analysis: children                                                                                |                             |
| Child's age                    | Age of child recoded in 3 or 4 categories: 0-6 (0-2,3-6), 7-13, 14-17                                                                                                                                                                                                                                                                                            | rx010                                                                                                      | EU-SILC 2007 UDB            |
| Father's age                   | Age of father recoded in 5 categories: <30, 30-34, 35-39, 40-44, 45+                                                                                                                                                                                                                                                                                             | rx010                                                                                                      | EU-SILC 2007 UDB            |
| Mother's age                   | Age of mother recoded in 5 categories: <30, 30-34, 35-39, 40-44, 45+                                                                                                                                                                                                                                                                                             | rx010                                                                                                      | EU-SILC 2007 UDB            |
| Household type                 | Combination of adults and dependent children in households                                                                                                                                                                                                                                                                                                       | hx060                                                                                                      | EU-SILC 2007 UDB            |
| Family type                    | This typology is based on direct links between children (aged 0-17) and their parents, all other members of the household (18+) are classified as other adults. Households where children do not leave with their parents and households where children belong to different parents (living in the same household) were classified as 'Other hhs with children'. | Using father (rb220) and mother (rb230) ID as in the EU-SILC. Children are defined as hh members aged 0-17 |                             |
| Work intensity (WI)            | The total number of months worked by the working age (18-64) members of the household in the income reference period divided by the total number of months these members could work in principle.                                                                                                                                                                | hx020 (WI=0, 0<WI<0.5, 0.5<WI<1, WI=1)                                                                     | EU-SILC 2007 UDB            |

|                                | <b>Definition</b>                                                                                                | <b>Methodological notes</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>Source of definition</b> |
|--------------------------------|------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|
| Parents' joint activity status | A reduced family type (see above) completed with the activity status of parents.                                 | Three categories of activity status were distinguished, based on the number of months spent in work or inactive status in the income reference period. Working full-time: more than half of the income reference period was spent in full-time work. Working part-time: more than half of the income reference period was spent in part-time work. Jobless: more than half of the income reference period was spent out of work (in unemployment, in retirement, studying, in inactivity). |                             |
| Father's education             | Highest ISCED level attained by father                                                                           | pe040 (0,1,2=low, 3,4=medium, 5=high; these categories correspond to 1,2=low, 3,4=medium, 5,6=high ISCED levels respectively)                                                                                                                                                                                                                                                                                                                                                              | EU-SILC 2007 UDB            |

## **Annex 2 Annexes to Chapter 2: Policy overview and policy impact analysis**

### **Annex 2.1 A specific overview of child poverty and deprivation in the 11 Member States for which case studies were prepared**

The scale and nature of child poverty vary markedly across the EU, as does the perception of its importance and the policies put in place for tackling it. In order to examine in more depth the features of the problem in different parts of the EU and the policies adopted, 11 Member States were selected for study and national experts in each of them were asked to contribute an analysis of the situation in these respects and to assess the strategy being pursued to combat child poverty and various aspects of deprivation. The countries in question are Germany, Estonia, Ireland, Greece, France, Italy, Hungary, Poland, Slovenia, Finland and the UK.

These 11 countries are reasonably representative of the differing features of child poverty across the EU, of its scale and incidence as between different types of household and of the main factors which seem to underlie the problem. Equally, the policies being followed seem to be broadly representative of those in place in other countries. As such, the studies carried out on these countries give an indication of the variations in the situation across the EU. They, accordingly, serve to emphasise that there is not a single type of problem with a common set of contributory causes and that, therefore, combating child poverty requires a different mix of policy measures in different countries. More accurately perhaps, it requires a policy mix with variations in the emphasis put on the different measures, since, in practice, the measures themselves tend to be similar across countries.

The main features of child poverty among children across the 11 countries studied are set out below along with an indication of the proximate factors underlying the differing scale of the problem, both those which tend to increase the number of children at risk and those which tend to reduce it. This is intended to describe the context in which the policies summarised in Part 2 of this synthesis are operating and the problems they are need to tackle.

A point to bear in mind throughout is that the aspects of the problem of child poverty and deprivation in the different countries, which are set out, are based on data, which relate to 2006 or 2007. There is, therefore, an inevitable dislocation, because of delays in the collection and publication of statistics, between the situation as perceived from the data and the present situation in which policies are operating. While in most cases, there are unlikely to have been major changes in the intervening period, in some there might have been, brought about perhaps by the policies adopted, many of which are described in Part 2 below.

#### **A2.1.1 The variation in the risk of poverty among children**

The 11 countries covered differ in terms of both the relative number of children at risk of poverty and the relationship of this to the risk for the population as whole (Figure 1). The proportion of children at risk varies from 11% in Finland (the second smallest in the EU after Denmark) to 25% in Italy (the largest in the EU). In three of the Member States (Germany, Estonia and Finland), the risk of poverty among children is less than for the overall population, while in another country (Slovenia), it is much the same. In the other 7 countries, the reverse is the case, and in some countries, substantially so. In Italy, Hungary and Poland, the proportion of children at risk is 5-7 percentage points larger than for the overall population.

The countries covered are broadly representative of the variation in the situation across the EU. In most countries, the risk of poverty is higher among children than other age groups – there are only another three (Denmark, Cyprus and Latvia) among the other 16 countries in which the reverse is the case and there are two (the Czech Republic and Slovakia) where the gap is as wide as in Hungary and Poland.

### **A2.1.2. Variations in risk across age groups**

In many countries – though not all – the risk of poverty varies between children of different age, which reflects differences in the underlying factors affecting the income of households with children. In Slovenia, Finland and the UK, the risk is higher among the very young aged under 3 than among older children, partly reflecting the effect of mothers working less and parents being younger, both tending to push down earnings from employment. In Estonia and, France, the reverse is the case, partly reflecting the relative concentration of income support from social transfers on women giving birth and on the youngest children. In the other 6 countries, there is only limited variation in the risk of poverty between age groups.

### **A2.1.3 Variations in risk across household types**

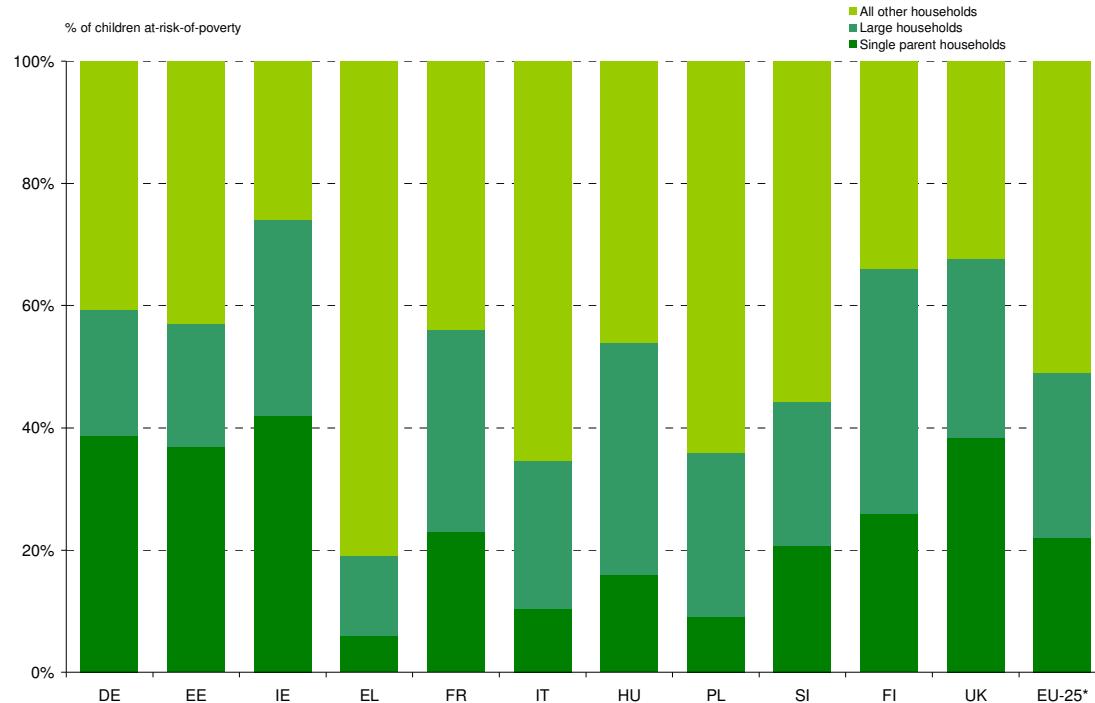

Children in all countries tend to be more at risk of poverty if they live with a lone parent (almost always their mother) or, to a lesser degree, if they live in a household with three or more children. This reflects in large measure the extent to which parents are in employment as well the income support available to them if they are not or if they work only part-time.

The risk is particularly high for children with lone parents in the UK and Ireland (where over 40% of them are at risk), while in Italy and Poland, the risk is especially high for children in large families (over 40% in Italy and 37% in Poland).

At the same time, the relative number of children living in these two types of household varies widely. It is high for children with lone parents in both Ireland and the UK (19-20% of all children) and well above average (14-15%) in Germany and Estonia. In consequence, children living in lone parent households make up a large share of all children at risk of poverty in these 4 countries (around 40% in each case). In sharp contrast, in Greece, Italy and Poland, children with lone parents account for under 10% of those at risk (Figure 2.1).

The relative number of children living in large families is also high in Ireland as well as in Finland (at around 31-32% of the total in each case) and, to a slightly lesser extent in France. In consequence, despite the risk of poverty being among the lowest in the EU in Finland and below average in both France and Ireland, children living in large families make up a large share of children at risk in all three countries (40% in Finland and around a third in both France and Ireland). They also make up a large share in Hungary (38%), where the risk of poverty and the relative number of children concerned are both comparatively high.

**Figure A2.1.1 Composition on of children at-risk-of-poverty by household type, 2007**

Source: EU-SILC.

Because relatively few children live in large households, they account for a smaller share of children with income below the poverty threshold in both Italy and Poland (despite the risk of poverty of the children concerned being relatively high), though still around a quarter of the total. In Greece, because even fewer children live in large households, they account for just 13% of all children at risk, the lowest in the EU.

In sum, children living in the two types of household, which tend to involve the highest risk of poverty, make up almost three-quarters of all children at risk in Ireland and around two-thirds in Finland and the UK, but only just over a third of the total in Italy and Poland and for less than 20% in Greece.

#### A2.1.4 Children with migrant parents

Children in migrant families are especially vulnerable to exclusion in most Member States, especially if they come from outside the EU, primarily because of more limited access of parents to employment. Although their risk of poverty is relatively high in almost all countries, the number of such children varies markedly across the EU.

The risk of poverty among migrant children is especially high in Finland, but since only 2% of children have both parents born outside the EU and they make up only 11% of all children at risk. By contrast, the risk of poverty is lower in the UK than in Finland, though still much higher than among other children, but they are much more numerous and account some 19% of all children at risk of poverty.

In France, migrant children account for much the same proportion of the total as in the UK (10%), but the risk of poverty among them is much further above the national average (45%) and they, accordingly, make up 28% of all children at risk.

Among the other countries covered, there are only a few children whose parents were born outside the EU in Estonia, Hungary, Poland and Slovenia. However, they make up some 16% of all children at risk in Greece, 13% in Germany and 12% in Italy.

The relative number of such children is also small in Ireland (3%) and their risk of poverty is seemingly below that of other children. Here, however, the main migrant group is made up of those from other EU Member States (who account for 6% of children), especially from the EU10 countries (those that entered the Union in 2004), who have a relatively high risk of poverty and who make up 10% of all children at risk.

## A2.1.5 Variations in the work intensity of households and the effect on the risk of poverty

In all countries, the risk of poverty among children varies inversely with the extent to which their parents are employed: it is invariably high if their parents are not working, or working comparatively little, and low if both of them are in full-time employment. The relative number of children, however, who fall into the different categories which can be distinguished in this respect – parents not working, working relatively little, one parent only in full-time employment, one parent in full-time employment and the other working part-time and both parents with full-time jobs – vary markedly across countries, as does the risk of poverty associated with being in a given category.

In Ireland and the UK, as a reflection of the relatively large number of lone parents, a relatively large proportion of children live in households where no-one is in work. Despite the fact that the risk of poverty of such children in the UK is slightly below the EU average and in Ireland, only slightly above, they account for 43-45% of all children at risk in the two countries (Figures 2.2 and 2.3). Their share of children at risk is also relatively high in Germany (35%), while in France and Hungary they make up almost 30% of the total. By contrast in Estonia Greece, Italy and Poland, few children have parents who are not working (well under 20% in each case), in part reflecting the limited amount of income support from the social welfare system, which makes it difficult to survive without earnings from employment.

In a number of the countries, there are also a comparatively large number of children living in households where one parent (sometimes a lone parent) may be employed but not full-time or for only part of the year. Their risk of poverty tends to be only slightly less than if their parents do not work at all. These two categories together – parents not working or working only part-time or part of the year – account for over 70% of children at risk of poverty in Ireland, 64% in the UK, almost 60% in Hungary and over 55% in Germany and France. In these 5 countries, therefore, most children at risk of poverty live in households with either no or limited access to income from employment.

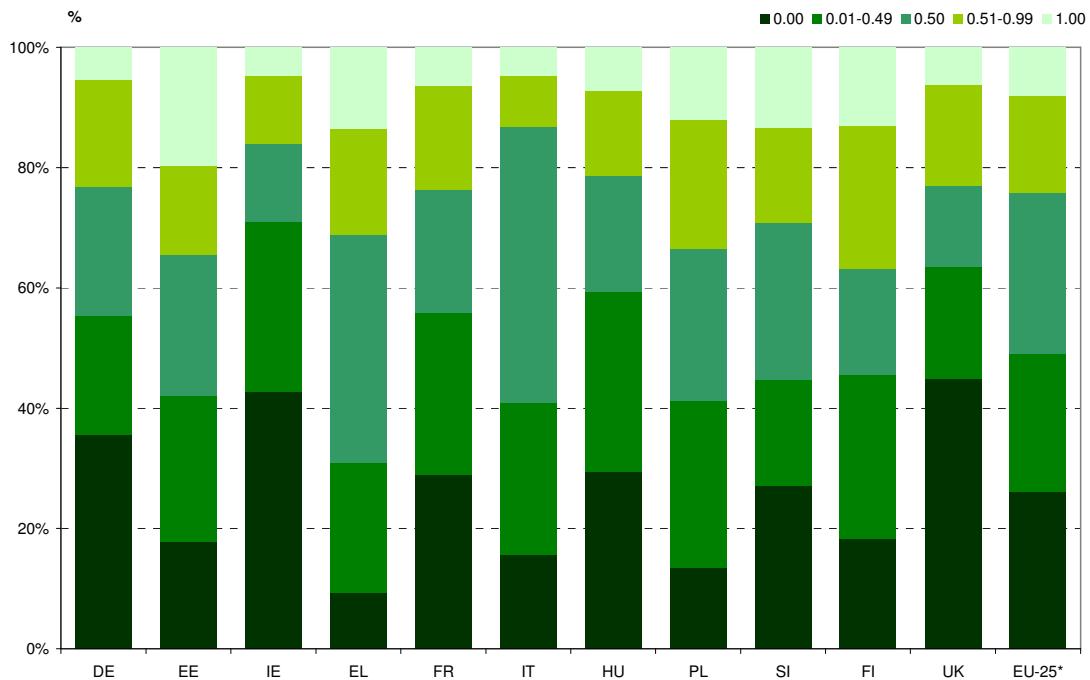

In the other 6 countries, most children have at least one parent in full-time employment. This in itself, however, is not sufficient to prevent a relatively high risk of poverty for many of the children concerned in a number of the countries. This is especially the case where only one parent, usually their father, is in full-time employment and the other – invariably their mother- is not employed at all. In Italy, over a third of children in this situation are at risk of poverty, in Poland, around 30%, in Greece, 27% and in Slovenia and the UK, 25-26%. In Italy and Greece, moreover, around a third of all children fall into this category and in Poland, 20%, while in the Slovenia and the UK, the proportion is only around 12%.

In consequence, in Italy, some 45% of children at risk of poverty have one parent in full-time employment and the other not in work, Greece, 38% and in Poland and Slovenia (despite the relatively small number in this category overall), around a quarter.

In Greece and Poland, the risk of poverty remains relatively high (around 20% or so) even if one parent is in full-time employment and the other works part-time. In the other countries, it is much lower (under 10% in all cases apart from Hungary – 11%), though in a number of cases, the relatively large number of children who are in this situation means that they still make up a significant share of all children at risk of poverty. In Germany, France and the UK, they make up 17-18% of the total, much the same as in Greece, and in Slovenia, 24%, more than in Poland (21%).

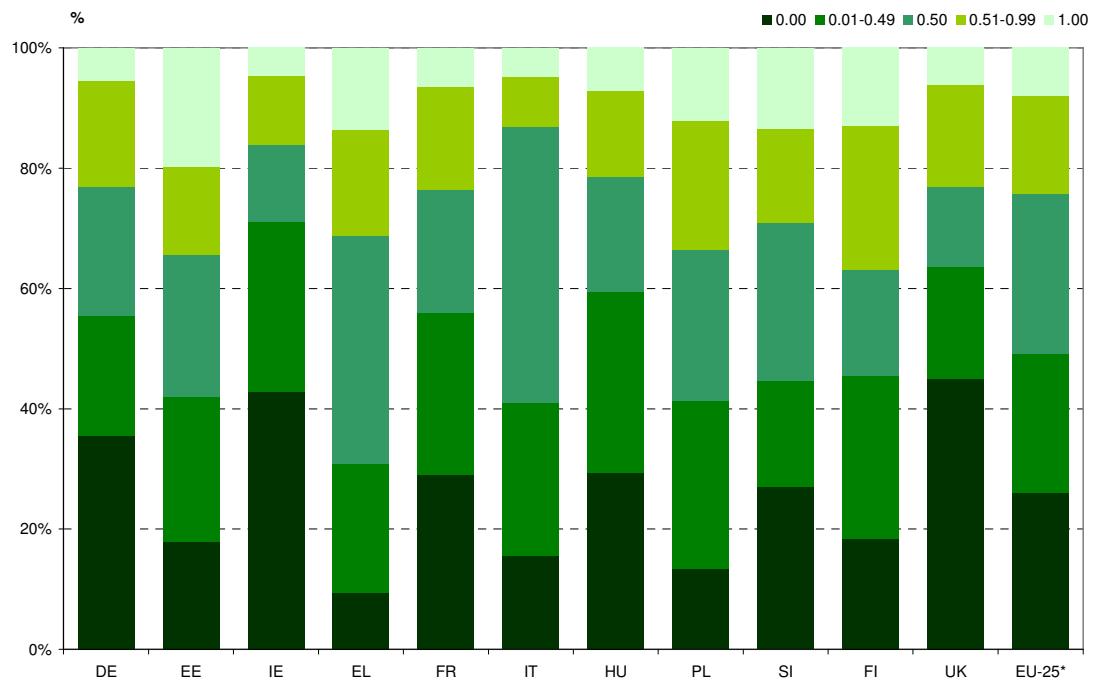

Although the risk of poverty among the children who have both parents in full-time employment is generally relatively low, there are still around 9% of children at risk who are in this situation in Estonia, Greece and Poland. Indeed, in Estonia, they make up 20% of all children at risk.

#### A2.1.6 The persistence of the risk of poverty

Although the risk of poverty among children, measured as those having income below 60% of the median in a given year – in this case 2006 – gives an indication of the threat of deprivation and social exclusion that they face, the threat concerned is much more serious if they continue to have an income below this level for several years at a time. The persistent rate of poverty, measured as having income below 60% of the median for at least two of the preceding three years as well as in the survey year itself (2006), is, therefore, a more significant indicator than the annual risk considered above.

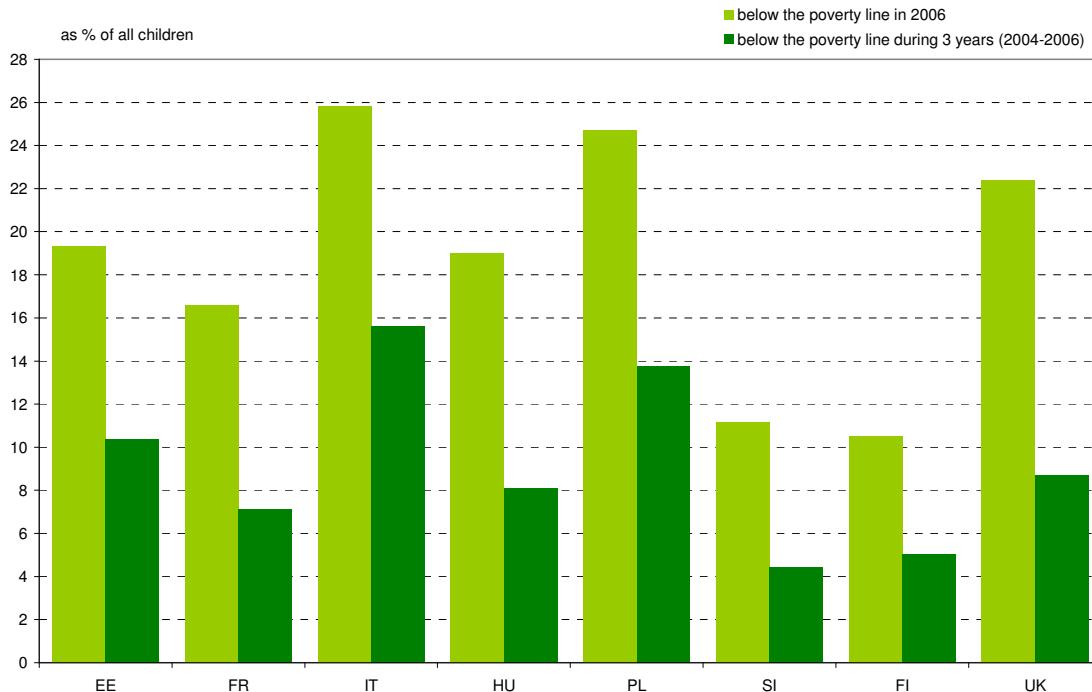

The difficulty is, however, that the data for the four years 2003-2006 needed to calculate the persistent rate are available for only four of the Member States covered (Estonia, France, Italy and Finland).

Among these countries, the proportion of children at persistent risk of poverty was highest in Italy, at around 19%. This implies that a large majority of those at risk in 2006, almost three-quarters, had also been at risk in at least two of the preceding years, signifying that for a significant proportion of children in Italy, having income below the poverty threshold was a long-term rather than temporary state of affairs.

In the other countries, the risk of persistent poverty was less, though it was still the case that 11% of children in Estonia and 9% in France were persistent risk, implying that around 55% of all those with income below the poverty threshold in 2006 had a similarly low level of income in at least two of the years 2003-2005. In Finland, only around 7% of children were at persistent risk, though these represented almost two-thirds of those at risk in 2006, indicating that, as in Italy, for most of those experiencing a risk of poverty, the risk was long-term rather than short-term.

For the other 7 countries covered, data are available only in 4 cases and then only from 2004. Taking those with income below 60% of the median in each of the years 2004-2006, the relative number of children concerned was again highest in Italy, where 16% continuously had household income below this level over the period, or 60% of those at risk in 2006. The proportion was only slightly smaller in Poland, 14%, while in Estonia, while it was less, it was, nevertheless, the case, as in Poland, that well over half (55%) of those at risk in 2006 were also at risk in the preceding two years (Figure 2.4).

**Figure A2.1.4 Proportion of children aged 3-17 at-risk-of-poverty, 2006**

Source: EU-SILC.

In the UK, the proportion of children at continuous risk of poverty was smaller than in Estonia (under 9%), despite the risk of poverty in 2006 being much higher (22% as opposed to 19%). Here, therefore, only 39-40% of children with income below the poverty threshold in 2006 also had income below this level in each of the two preceding years. This was also the case in Slovenia, where as a result only just over 4% of children were continuously at risk over the three years, less than in Finland. In both Slovenia and the UK, therefore, for around 60% of those at risk in 2006, having income below the poverty threshold was a transitory rather than a long-term phenomenon.

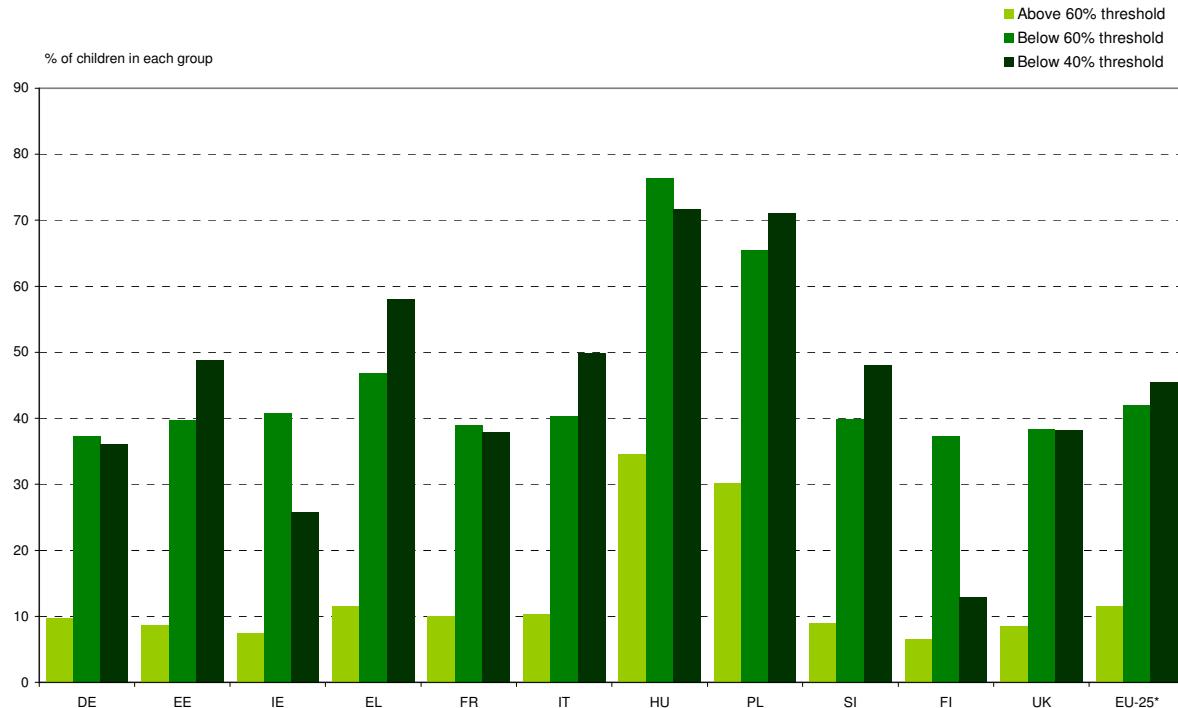

### A2.1.7 Material deprivation and the risk of poverty

The proportion of children who are materially deprived according to the indicator of this recently agreed at EU-level to monitor social inclusion across Member States – essentially living in a

household which is not able to afford three or more basic items of expenditure included in the EU-SILC<sup>1</sup> – gives a potential insight into the extent of absolute poverty among children.

The proportion of children living in households which are materially deprived according to the indicator are highest among the selected countries in Hungary (42%, the second highest figure in the EU after Latvia) followed by Poland (the third highest figure) and lowest in Slovenia (13%) and Finland (10% - still higher than in Denmark, Sweden, Luxembourg and the Netherlands). In five countries (Germany, Ireland, France, the UK and, perhaps surprisingly, Estonia), the proportion was between 13% and 15% and in the other two (Greece and Italy), only slightly higher (Figure 2.5).

**Figure A2.1.5 Material deprivation among children aged 0-17, 2007**

Source: EU-SILC.

In Hungary, material deprivation affects around a third of children in households even with income above the poverty threshold and in Poland, around 30%, whereas in the other countries, it is only around 10% or less. In Hungary and Poland too, a substantial majority of children at risk of poverty (76% and 66%, respectively) live in households indicated as being material deprived. In Greece, the figure is only slightly less than half (47%), while in the other 8 countries, it varies within a narrow range of between 37% and 41%, still significant, but signifying that most of the children identified as being at risk of poverty in these countries are not materially deprived according to the indicator of this.

## A2.1.8 Absolute poverty

The relative number of children who are materially deprived at lower levels of household income relative to the median, specifically at 40%, is sometimes taken as a measure of extreme, or absolute, poverty. At this level of income, around 71-71% of children in Hungary and Poland are indicated as living in households experiencing material deprivation. In Hungary, however, this is a smaller proportion than for those with income of 60% below the median, which suggests that for these households, income as recorded in the EU-SILC may not be a reliable measure of purchasing power, leaving out of account, as it does, accumulated wealth and borrowing, as well as perhaps income from informal activities.

Among the other countries, the proportion of children in households suffering material deprivation at income below 40% of the median is close to 60% in Greece and around 48-50% in Estonia, Italy and Slovenia, all significantly higher than for those with income below 60% of the median. In these

<sup>1</sup> The items in question are: a telephone, a color TV, a washing machine, a car, one week's annual holiday away from home, a meal with meat, chicken, fish (or vegetarian equivalent) at least every other day, keeping the house adequately warm. In addition, there are two questions relating specifically to a household's financial situation and being arrears on mortgage or rent payments, utility bills, hire purchase installments or other loan payments.

countries, income this low is, therefore, associated with deprivation among around half or more of children.

In the other countries, the proportion with income below 40% of the median indicated as being deprived is similar to, or less than, the proportion with income below 60%, raising a questionmark over how far income in these households accurately reflects purchasing power. This is especially so in Ireland and Finland, where only 26% and 12% of children, respectively, are indicated as being materially deprived.

Nevertheless, a combination of living in a household with income below 40% of the median and experiencing material deprivation according to the indicator could perhaps be taken as a measure of extreme poverty. On this measure, some 6% of children in Greece and Poland might be considered to be exposed to extreme poverty, 5% in Italy and 3% in Estonia, Hungary and the UK. In all the other countries, the proportion is only around 1% or less.

The evidence available on the relative number of children living in absolute poverty, outside of what can be gleaned from the EU-SILC, is limited in most countries. There is some evidence from Italy, where on the basis of an ability to afford a 'basket of good and services considered essential for an acceptable standard of living', taking account of family size, age composition, location and so on, some 4% of families are estimated to live in absolute poverty in 2007 (i.e. close to the above estimate) and around 6% in the south of the country. For families of three or more children, the estimate is put at over 10%.

In Estonia, around 9% of children are estimated to have a level of income below what is required to avoid absolute poverty (i.e. much higher than the above estimate), significantly more than for the overall population (6.5%), though much lower than 10 years earlier when it was estimated at 40%. The deep recession which the country is now experiencing could, however, push this proportion up considerably.

In Slovenia, the research carried out into the living conditions of low-income families in recent years does not indicate a significant problem of absolute poverty (in line with the evidence on material deprivation in the EU-SILC), partly because of the availability of social assistance and the work of voluntary organisations.

In Ireland, the evidence indicates that absolute poverty predominantly exists among children of travellers (or Roma), those from migrant families, those with disabilities and those who are homeless, which of course are not mutually-exclusive groups. Lone mothers who are asylum-seekers or refugees face particular problems of poverty and social isolation compounded by a lack access to childcare, an inability to work and a language barrier.

### A2.1.9 Trends in the risk of poverty

It is difficult to be sure about the way that the risk of poverty among children has changed over time because of the lack of a common and consistent source of data. The EU-SILC potentially provides that data source, though the period for which the data are so far available is too short to identify trends or even to be confident about the changes which have occurred over the period because of the sample nature of the data. There is, therefore, an inevitable need to rely on national data to discern how the risk has changed over the years.

In Germany, France and Italy, the data suggest that poverty among families has changed relatively little over the past decade or so. In Ireland, Estonia, Poland and Slovenia, it seems to have fallen. In Greece and Finland, it appears to have risen, in the latter markedly since the mid-1990s, though it still remains relatively low, while in the UK, the evidence suggest that it rose considerably between 1979 and 1997, but since then it may have fallen slightly. In Hungary, the data are uncertain, but they seem to show little change in the second half of the 1990s followed by a slight decline up to 2005 and little change since then.

## Annex 2.2 Supporting Tables for Chapter 2

**Table A2.2.1 Proportion of children aged 3-17 at-risk-of-poverty, 2006**

|             | Below poverty line in 2006 | Below the poverty line during 3 years (2004–2006) |
|-------------|----------------------------|---------------------------------------------------|

|                                                 | <b>Responsiveness to policy change</b> (reflecting the length of the causal chain between policy interventions and measured outcomes): high ( short), medium (medium) and low (long). |            |              |                   |                    |                                                                                          |                                        |                                  |                                    |                        |

**Statistical robustness:** 5 (highly robust), 4 (caution is warranted, confidence intervals to be published), 3 (for majority of countries caution is warranted and conf intervals to be published, for other the data cannot be published), 2 (for majority of countries a significant data improvement/sample size increase is needed, and 1 (to have reliable data a new dataset is to be designed).

**Level of cross country comparability:** 3 (no comparability problems), 2 (unclear institutional or cultural specificities prevail), 1 (either institutional or cross/cultural problems or both hinder comparability across countries or there are or major data harmonisation problems).

## Annex 3.3 Poverty of the Roma Children<sup>4</sup>

### 3.3.1 The situation of Roma children in the EU

Roma<sup>5</sup> are the largest ethnic minority in Europe and perhaps the most vulnerable. According to Liégeois<sup>6</sup> approximately 6.6 million Roma are living in the EU-27 (Table 1), of which an estimated 70 percent (some 4.5 million Roma) live in 8 EU Member States in Central Eastern and South Eastern Europe (CEE and SEE), most of them under conditions of extreme poverty and social exclusion. Moreover, a large number of Roma are living in the EU15 member states, in some of which (particularly in Italy and Spain), due to immigration from Eastern Europe, the share of Roma is increasing.

**Table A3.1 Estimated number of Roma in the EU (upper-estimation)**

|            |           |             |         |           |             |

In addition, nearly 2.5 million more are estimated in the bordering area of the EU, i.e. from Russia to Turkey. The largest Roma community within the EU counts around 2 million people in Romania and there are also large (with at least at least half a million members) Roma communities in other new EU Member States, especially in Bulgaria, Hungary and Slovakia

The disadvantages which the Roma face arise from a complex interaction of interdependent factors, in particular, very low levels of education and employment, severe poverty, poor housing conditions and large families. Their situation is, moreover, aggravated by the fact that most of them tend to live in depressed regions where the lack of employment opportunities and basic infrastructure adds to their disadvantages. These are further reinforced by widespread discrimination.

The vulnerable situation of Roma is known throughout Europe, and well documented by a number of international organisations<sup>7</sup>. Nevertheless, only a very limited number of cross-country surveys attempted to research the situation of Roma in details and with a comparable methodology, and the few researches<sup>8</sup> is available only for Eastern and South-Eastern-Europe. Consequently it is very hard

<sup>4</sup> Prepared by Anikó Bernát

<sup>5</sup> The official EU term for Roma is “Roma, Gypsies and Travellers”, but we are using the term “Roma” in this paper, because the Roma community, as a self-assignment, usually uses this denomination while the term “Gypsy” often used by other people but not Roma themselves and is often considered as a pejorative term by Roma. Traveller communities are living in Western Europe in general, but this paper focuses on Central and Eastern European Roma, therefore it is better to refer to this ethnic group as Roma.

to compare the situation and opportunities of Eastern-European Roma to those who live in the EU 15 countries.

The indicators derived from the most reliable comparable empirical research<sup>9</sup> carried out in 11 CEE and SEE countries in the areas in which Roma most live highlight the gap between Roma and their non-Roma neighbours in all of the countries covered. The beyond-EU coverage of the report is very much justified: extending the focus also on the neighbouring countries helps making a better comparison and interpret the findings for the EU countries in a wider context.

Surveys report that the Roma population differs from the majority population in terms of the main demographic trends, in particular, birth rates (higher than average), the timing of marriage (earlier than the average), family structure (larger families and households) and age profile (lower rates of Roma among older age groups and higher rates among the younger cohorts), for example:

In Romania, Slovakia, Hungary and the Czech Republic Roma households have on average 3-4 children, but it can be much higher in some cases, for example, in poor Roma settlements in Slovakia, the average number of children per family is nearly 8.

The number of children per Roma mother is also higher than that of the majority of women across the region. In Romania, the total fertility rate, i.e. births per woman, for Roma is more than double than for the rest of the population (2.6 for the Roma and 1.2 for non-Roma). In the Czech Republic, married Roma women have on average 5 children by the end of their reproductive lives (at age 45-49) compared with an average of 2.2 children for other women in the country.

Large numbers of children and large sizes of family are a corollary of early marriage: In Romania, Hungary and Slovakia at least 4 out of 10 Roma in the 16 to 19 age group are already married and at least 7 out of 10 in the 20 to 24 age group. In Bulgaria, though the proportions are slightly lower, the pattern is similar (33% being married among 16 to 19 year-old and 69% among 20 to 24 year-olds).

Parallel to this, there is much evidence that life expectancy, infant mortality and morbidity are significantly worse for Roma than for the majority population in CEE countries. For instance infant mortality rates are roughly double the national averages in the Czech Republic, Slovakia and Hungary, and nearly three times higher in Romania.<sup>10</sup>

As a result, the shape of the age pyramids for Roma in Bulgaria, Czech Republic, Hungary, Romania, and Slovakia show a large number of children and young people and fewer people in the older age groups. It also means that the Roma population, on average, is very young in the region, with a median age of 19 years, while the corresponding figure is 34 years for the total population.<sup>11</sup>

The level of education of the Roma in the region is extremely low compared with the EU25-average in general, with the majority population in the southern new member states or with the majority population living in close proximity to Roma: the share of the low educated (primary school as maximum) among Roma is 2 to 9 times larger than among the majority population. Segregation within schools and the education system is a major issue underlying the very low education level of Roma, which is of key importance for their vulnerability in the region as well as for their chances of social inclusion.

Further, as the Faces of Poverty survey indicates, rates of economic activity among the Roma population are also extremely low in the region: on average, only 1-2 out of 10 Roma aged 15 or over have earnings from formal or informal economic activity. The situation is better only in the Czech Republic and Albania, where somewhat higher proportions of Roma are in paid employment, though only slightly so.<sup>12</sup>

<sup>11</sup> UNDP (2002)

<sup>12</sup> UNDP (2005)

The small share of active earners among Roma leads directly to a lower level of income and poor living standards. Income of under USD 4.30 a day in purchasing power parity terms<sup>13</sup> can be used as a measure of absolute poverty. According to the UNDP (2005) survey, the proportion of Roma with income of less than USD 4.30 is the highest in Albania, Kosovo and Romania (at least two-thirds of the Roma in each case), while around half of the Roma have income below this in Serbia, Macedonia and Bulgaria and the proportion is slightly smaller in Montenegro and Bosnia-Herzegovina. The smallest proportions are in the economically more developed Central European countries and Croatia. (Table 3)

Poverty risk (relative poverty rate of the Roma to the rest of the neighbouring population) is the highest in Montenegro and Bulgaria, where eight times more Roma are living under the poverty line than non-Roma, despite the fact they live in the same locality. Wide differences are also evident in the other Balkan countries, while the gap is narrowest in the Central European countries. (Table 2) This pattern is similar to that shown by labour market indicators and suggests that disparities in income levels (or labour market conditions) between countries are more important in explaining differences between the situation of Roma and that of the majority population than other factors.

**Table A3.2 Income based poverty among Roma and majority population in close proximity to Roma (percent of the respondents under the USD 4.30 PPP income based poverty line)**

|                         | Majority population<br>in close proximity<br>to Roma | Roma population | Relative poverty<br>risk (poverty rate of<br>Roma/neighbouring<br>majority) |

Exploring data infrastructure that is feasible to provide commonly agreed national indicators on ethnic background

Ethnicity is a very important factor that makes large differences in everyday life and in the situation and opportunities of adults and children with minority background living in the EU, therefore it is inevitable to deal with it seriously, i.e. elaborating useful solutions based on real evidences. However there is clearly a gap between the availability and the necessity of data on Roma ethnicity in most EU countries. This first pre-requisite for a policy relevant and policy assisting monitoring is, therefore, to collect data on ethnicity. Knowing that the issue has sensitive and difficult legal, ethical and methodological aspects, member states could first sign up to common guidelines for collecting data on ethnicity. Then, on the basis of this, harmonised data collection for at least in the countries with a sizeable Roma community would be a must before any policy targets be agreed. Without comparable datasets, there is no chance to elaborate adequate evidence based policies to improve education of the Roma population, to reduce labour market disadvantages, but there is no chance even to assess discrimination itself.

The currently available indicators in the EU-SILC survey do not capture ethnicity as such. Neither ethnicity, nor country of birth highlights the particular ethnic situation properly, including that of the Roma.

<sup>13</sup> Using USD 4.30/day as an absolute poverty threshold is based on the practice of the UN and UNDP, which suggest this methodology in Millennium Development Goals. For instance see MDG Reports 2004:16. We apply this indicator because cross-country poverty figures for Roma in the countries examined here are available only from UNDP's survey.

Adding questions on ethnicity to EU-SILC would be a step ahead, so that a basis of a new indicator on poverty risk by minority background could be created. Asking questions on self reported ethnicity in the survey with allowing multiple ethnic identities could be a good compromise for the legal, ethical and methodological concerns.

However, the sole use of EU-SILC may not be adequate as Roma in some of the countries live in difficult-to-reach localities or are effectively travellers who can be difficult to find. Therefore a supplement sample to the EU-SILC could also be considered.

### **3.3.2 Ethnic discrimination and its measurement, possible indicators**

The EU legislation on discrimination is based on two directives from the year of Millennium. Directive 2000/43 (Racial Equality Directive) prohibits discrimination on grounds of racial or ethnic origin both within the labour market and in other important aspects of social life such as housing, healthcare, education, social protection and access to goods and services, while Directive 2000/78 (Employment Equality Directive) prohibits discrimination on grounds of religion or belief, disability, age and sexual orientation in employment and vocational training.

EU law distinguishes discrimination whether it is direct or indirect and discrimination can also be measured directly and indirectly. Discrimination surveys (for example the one carried out by Eurobarometer in 2008) measures discrimination directly (when factors unrelated to merit, ability or potential of a person or group, are used as an explicit reason for discriminating against them) but with a minimal validity, medium reliability and generalisability. Direct method means the research of the perception and prevalence of discrimination, victimisation and situation test, while indirect methods can be using attitudes (e.g. "Feeling comfortable having a Roma as neighbour") or other phenomena such as wage differences among different groups with the same features (education, experience, age etc.).

There were also examples for discrimination researches carried out by experiments that lead to a new method called discrimination testing (previously used in juridical processes) in which social science methodology meets the advantages of the experimental methods<sup>14</sup>. This is a controlled (or field) experiment: people found in a natural setting are assigned to treatment and control conditions. Testers are randomly assigned to pairs (e.g. one of each race) and matched on equivalent characteristics (e.g. socio-economic status), credentials (e.g. education). Members of each pair are typically trained to, for example, act in a similar fashion and are equipped with identical supporting documents. Overall, this method of measuring discrimination increases the reliability, validity and generalisability of the research.

## Annex 3.4 Children items asked at household level in EU-SILC 2009 and suggestions to use the various variables in monitoring child well-being regularly

This summary gives an overview of child related items asked in the 2009 wave of the EU-SILC. The validation of these variables can only be made after the fieldwork, when harmonised dataset is going to be released (expected in 2011).

| Name                                                                                      | Description                                                                                                                                                                                              | Values                                                                               | Link to the child well-being domains | Comments/suggestions                                                                                                                                                            |
